SOLUTIONS

Meeting Today's Cattle-Feeding Challenges

QLF offers feedyards a wide range of products that deliver an even wider range of benefits. It's no wonder that the majority of commercial cattle feeders in the U.S. utilize a liquid supplement.

ENHANCED NUTRITION

QLF feedlot products can provide supplemental protein, macro and micro minerals, vitamins and additives. Individual formulations can meet the needs of any situation, including diets high in grain, silage, or co-products.

IMPROVED PALATABILITY

While palatability is hard to measure, there is no question that feeds with undesirable characteristics can reduce voluntary intake. This can be of special concern with starter diets, dusty ingredients, and fermented feeds. QLF supplements tie up fines, cover up unfamiliar odors, and appeal to cattle.

DIET UNIFORMITY

One of the greatest values a liquid supplement brings to a mixed ration is greater diet consistency. QLF helps improve initial TMR mix, holds fines, and reduces animal sorting. Each bite is that much closer to the diet that was formulated, and the risk of nutritional upsets is reduced. Trace ingredients and additives are also delivered more consistently, improving returns on the investment they represent.

CONVENIENCE

QLF supplements can provide a **complete package**, simplifying inventory, measuring, and mixing. The **ease of application** supports improved accuracy. Liquid supplements offer **storage simplicity** with very little shrink.

ECONOMIC ADVANTAGE

Research shows improved feed efficiency with liquid vs. dry supplements. There is minimal waste of QLF feeds, stored in closed systems, and they are economical to handle. Most importantly, they offer a good value for the nutrition they deliver.
