

Body condition of the cowherd plays an important role in herd productivity, calf performance and profitability! Improving herd condition prior to calving from 4.5 to 5.5 can increase annual income per cow by establishing a prolific dam who produces heavier calves at sale time.

QLF cow/calf supplementation programs can improve utilization and intake of available forages and supply additional nutrients needed to maintain or gain cowherd condition.

*numbers based on calf market/cwt = \$165
